Question 1 | Correct | Mark 1.00 out of 1.00

Convert the following algorithm into a program and find its time complexity using the counter method.

```
void func(int n)
{
    if(n==1)
    {
        printf("");
    }
    else
    {
        for(int i=1; i<=n; i++)
        {
            for(int j=1; j<=n; j++)
            {
                printf("");
                printf("");
                break;
            }
        }
    }
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

Answer: (penalty regime: 0 %)

```
1  #include <stdio.h>
2
3
4  int main()
5  {
6      int n;
7      int count = 0;
8
9      scanf("%d", &n);
10
11     if (n == 1)
12     {
13         count++;          // printf("")
14     }
15     else
16     {
17         count++;          // i = 1
18
19         for (int i = 1; i <= n; i++)
20         {
21             count++;       // j = 1
22
23             for (int j = 1; j <= n; j++)
24             {
25                 count++;   // j <= n
26                 count++;   // printf("")
27                 count++;   // printf("")
28                 count++;   // break
29                 break;
30             }
31         }
32
33         count++;           // last failed i<=n
34     }
35 }
```

```
36 | printf("%d", count);
37 |
38 | return 0;
39 | }
40 |
```
